

SECURE BASELINE

SECURE BASELINE SCANNING SOLUTION

CYRISMA uses the Center for Internet Security's (CIS) Critical Controls and DISA's Secure Technical Implementation Guides (STIGs) as the benchmarks for secure configuration scanning to protect both commercial and government entities against breaches. The systems being scanned are put through hundreds of tests under different policy categories and assigned performance graded based on misconfigurations and close security gaps, and the functionality to create and execute mitigation plans from within the CYRISMA platform.

CYRISMA's secure baseline scans can be performed on all version of Windows, Linux and Mac operating systems (OS). Users can choose between scans based on CIS Controls and DIS STIG and deep dive into configuration settings tied to specific policy categories like network security, password policy, WLAN settings, group policy, etc.

In addition to hardening OS configuration and reducing risk, organizations can use CYRISMA's secure baseline scans to identify configuration drift, improve change management and meet compliance requirements.

The Power of CYRISMA

- 1 DISCOVER** configuration weaknesses and standardize OS configurations based on selected security frameworks. Strengthen the security posture of your organization and reduce the risk of a breach, without impacting end users.
- 2 UNDERSTAND** the rationale behind specific security configuration recommendations and how misconfigurations and errors in system settings across computing environments can open up attack opportunities for threat actors.
- 3 MITIGATE** configuration weaknesses based on scan results and identify and control configuration drift over time by comparing current scan results with historical data. Maintain a consistently strong cybersecurity posture.
- 4 MANAGE** secure systems configurations over time to reduce cyber risk, create operational environment and meet security and industry-specific compliance requirements like PCI DSS, HIPAA, CCNA, GDPR, etc.
