CYRISMA

VULNERABILITY MANAGEMENT

A COMPLETE INTERNAL AND EXTERNAL VULNERABILITY SCANNING SOLUTION

CYRISMA's feature-rich risk management platform comes with a powerful vulnerability scanner with options to run both internal and external scans. Our multi-tenant platform gives security teams complete visibility in to the vulnerabilities in network-connected devices, systems and web applications, and allows them to triage these vulnerabilities based on severity levels, create mitigation plans, and patch systems quickly.

Running either internal or external vulnerability scans, you can not only find hidden vulnerabilities in your own or customers' environments, but also see the root cause of these vulnerabilities.

CYRISMA simplifies vulnerability management by providing security practitioners with all the information and detailed analysis they need to take appropriate steps to keep networks and systems secure.

Internal & External Scan Options

Agentless & Agent-based Scans

The Power of CYRISMA

1 **DISCOVER** - run easy-to-set up, quick scans to discover vulnerabilities and zero-day risks against both identified and unidentified targets and shadow IT. Map vulnerabilities to affected assets and applications to get a complete picture of your attack surface.

2 **UNDERSTAND** - easily analyze and triage identified vulnerabilities based on assigned severity levels and possible business impact, and find the root cause of vulnerabilities for better-informed remediation.

3 **MITIGATE** - mitigate vulnerabilities in a timely fashion through an internal mitigation engine to assign mitigation actions to designated individuals responsible for different types of assets i.e. AD server, workstations, web servers, DB servers, etc..

4 **MANAGE** - manage your risk landscape by setting up regular vulnerability scans to make sure that you find new vulnerabilities early, and reduce your risk exposure to a tolerable level.
