# Version 2.102.1.133
# Release Date: January 16, 2025

CYRISMA Version 2.102.1.133 feature releases and updates

## FIXES IN USER EXPERIENCE AND FUNCTIONS

### Admin

Targets- Upgraded the network discovery modal to collect additional device details, including MAC Address, Manufacturer, Fingerprint, and Certificate Information. UI improvements include preselecting the operating system based on Fingerprint data, with user options to adjust selections.

### Compliance

Compliance Assessment- Fixed an issue where answers in compliance forms were reset after using the 'Select Filter' feature.

Compliance Assessment- Resolved an issue where users could not re-upload a file after removing it in the 'Add Evidence' modal. Users can now re-select and upload the same file without restrictions, ensuring consistent functionality across all supported file types.

Compliance Assessment- Enhanced the 'Select Filter' dropdown in compliance categories to maintain independent filters for each category. Adjusted the dropdown's visual design for clarity and ensured it remains visible after selection, allowing seamless navigation and filtering.

### Dark Web

Setup Dark Web Monitor- Updated the Dark Web Monitor editing interface to grey out and disable the 'Domain Name' field for validated monitors. This ensures consistency and prevents unauthorized changes to validated domain names while keeping other fields editable.

## Mitigation

Create a Mitigation- Added support for creating and managing Google Mail and Google Drive mitigation plans.

## MSP

Address Details Modal- Resolved an issue where changes to the "Instance Label" field in the Address Details modal were not reflected in the client instance.

Autotask Integration- Fixed an issue preventing Autotask tickets from being created.

Edit User Modal- Fixed an issue in the "Edit User" modal where the enable/disable options were not functioning correctly. User account statuses now update accurately.

Halo PSA Configuration- Resolved an issue causing an error screen when filtering companies in the 'Map Companies' tab of the Halo PSA configuration.

## Overall Risk Dashboard

Fixed a layout issue where bullet points for single-digit numbers appeared too narrow in the Residual Risk Cost modal. Improved spacing and alignment ensure a visually consistent display.

## Site-Wide

Corrected title inconsistencies across the Data, Vulnerability, and Mitigation Dashboards.

Updated all pages and charts within the application to be fully responsive across screen resolutions from 1280px to 1920px.

## Vulnerability Scan

Renamed the 'Targets with the Most Vulnerabilities' table to 'Vulnerability Summary by Target' and added pagination to display all scanned targets within the selected reporting period.
